Eyster's Machine and Wire Products Purchases Wafios B-10-60 Tubing Bender

Shrewsbury, PA, December 2009 – Eyster's is expanding their capabilities in tube bending with the purchase of a new Wafios B-10-60. The machine is the first of its kind in the United States. The B-10-60 is a fully electric CNC bender for simple two dimensional or complex three dimensional parts. The bender has a swinging head capable of making left or right-hand bends. Most conventional benders can only bend left only or right only. The B-10-60 is also capable of generated bends. This means the bend radiuses can be almost limitless and tooling is able to be more flexible or used on more parts equaling a reduction in tooling costs to customers. These new capabilities will allow engineers and designers to generate more complex tubes to fit their needs.

Eyster's can now offer tube bending capabilities up to 2 inch diameter schedule 40 pipe or 2.375 inch diameter tube with a .080 inch wall in carbon steel. Part lengths can be as long as 20 feet. The B-10-60 complements our existing CNC tube bending abilities which were up to 1.25 inch diameter .080 wall tubing.

Eyster's strives to stay on the cutting edge and offer our customers new ways to solve problems or create existing parts. Please visit our website to see if we can assist you with your machining, wire forming, or tube bending needs. www.eysters.com
